AB The invention discloses the use of amidine compds. in the treatment of amyloid-related diseases. In particular, the invention discloses a method for treating or preventing an amyloid-related disease in a subject comprising administering to the subject a therapeutic amount of an amidine compound. The compds. of the invention reduce or inhibit amyloid fibril formation, neurodegeneration, or cellular toxicity. Preparation of compds. of the invention, e.g. I, is described.

 AB The synthesis and some pharmacol. properties of new sym. compds. are described. The cytotoxicity, apoptosis induction and caspase-3 activation of the synthesized compds. have been evaluated against three human cancer cell lines. Compds. that showed cytotoxic activity were tested as proapoptotic and caspase-3 activators. Some of the compds. showed interesting values as apoptosis inducers and caused a notable increase in caspase-3 levels.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB In an approach to discover new inhibitors of trypanothione reductase from Trypanosoma cruzi, the causative agent of Chagas' disease, a virtual high-throughput screening was performed. Two structurally new types of inhibitors emerged, the antimicrobial chlorhexidine [1,1'-hexamethylenebis[5-(4-chlorophenyl)biguanide]], a linear competitive inhibitor (K_i = 2±1 μM), and a piperidine derivative acting as mixed inhibitor (K_i = 6.2±2 μM and K_i' = 8.5±2 μM). Neither compound interferes with human glutathione reductase. Based on chlorhexidine, different series of compds. were synthesized and studied as inhibitors of T. cruzi trypanothione reductase. Most efficient derivs. were three bis(amidines) showing mixed type inhibition with K_i, slope and K_i,int values of 2-5 μM and 16-47 μM, resp. Although these compds. did not exert an improved inhibitory potency compared to chlorhexidine, the change from competitive to mixed-type inhibition is advantageous, since substrate accumulation does not overcome inhibition. Remarkably, all three derivs. carried two copies of an identical 2-methoxy-4-methyl-1-(phenylmethoxy)benzene substituent.

AB Novel amidine and diamidine compds. (1st of 7 claimed Markush formulas show as 1; variables defined below; e.g.
 4,4'-bis(6-amidinobenzimidazol-2-yl)-1,2-diphenylethane tetrahydrochloride (II)) may be useful in the treatment of microbial infections, including mycobacterial, fungal and protozoal infections. Pharmaceutical formulations comprising these compds. can be used in methods of treating microbial infections. Neither pharmacol. activity nor therapeutic use is claimed, but the effectiveness of 11 examples of the claimed compds. against Trypanosoma rhodesiense and Plasmodium falciparum is tabulated. Although the methods of preparation are not claimed, 9 example preps. of claimed compds. and intermediates are included. For example, II was prepared (64 %) from 4,4'-diethyl-1,2-diphenylethane, 4-amidino-1,2-phenylenediamine hydrochloride hemihydrate and 1,4-benzoquinone in EtOH. For I: X' and X'' = alkyl, alkylene, O,

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB Regular rigid-flexible copolymers composed of aramid segments and aliphatic

chains formed of 5 to 10 CH₂ groups were synthesized using a two-stage procedure. A first stage consisted of synthesizing, under Yamazaki-Higashi phosphorylation conditions, poly(paraphenylene terephthalamide) blocks or macromonomers of different lengths by using an excess of phenylene diamine. These macromonomers, with functionalized amine extremities, were reacted in a second stage, using the Higashi phosphorylation conditions, with a terephthalic-acid end-capped aliphatic amine. Macromonomer mol. wts. and polydispersities were estimated from viscosity and NMR measurements, whereas for block copolymers viscosity measurements and size exclusion chromatog. of allylated deriva. were performed. Block polydispersity increased with increasing length of block, but remained below 1.6. Copolymers were found to have Mw values from 2500 to 8600 g mol⁻¹, depending on block length and aliphatic chain used. Polydispersity indexes were systematically higher for block copolymers than for macromonomers, with values ranging from 1.6 to 4.7. Mw and Mw were found to be comparable for all copolyaramids, which indicates that addition of short aliphatic chains had a negligible effect on Mark-Houwink parameters.

AB The use of chlorotrityl resins for the immobilization of amines is sometimes deterred by the lengthy process of loading the reactants on the resins and product decomposition caused by the reactive chlorotrityl group in the presence of 1% TFA as a cleavage agent. Here, we report improved methods developed for selective and efficient loading of aminobenzoic acid derivs. on chlorotrityl resins by employing diisopropylethylamine (DIEA) and for cleavage of aniline-containing products from the resins without decomposition utilizing scavenger 2,2,2-trifluoroethanol. These methods led to the synthesis of a library of 144 discrete chems., e.g., 1, as potential farnesyltransferase inhibitors (FTIs) using IRORI's radio-frequency-encoded sorting technique and to the study of the applicability of the bivalence approach to the development of FTIs.

AB N,N'-bis(p-carbomethoxybenzoyl) butane (and ethylene, hexamethylene) diamine (T4T and T2T, T6T-dimethyl) was synthesized firstly, then used as hard segments and polymerized together with poly(tetramethylene oxide).
A series of polyester-amide polymers were obtained. It was studied that how the structure of hard segment and the number average mol. weight determined the properties of obtained polymers.

 AB The preparation methods, choice of catalysts, and reaction kinetics of 1 of the monomers, diesteramide (DEA), of polyester-amides were studied in detail. The chemical structure of DEA was analyzed. The polyester-amides (PEA) were obtained by melt copolym. with DEA. DEA can be synthesized by DMT and hexamethylenediamine with the catalyst EX-1 or EX-2. The relation between reaction rate of synthesizing monomer and concentration of hexamethylene diamine is first-order kinetic relation.

 AB The component with amide bond such as T4T and T2T were synthesized at first, then it was polymerized with ethylene glycol in a given of amount

of substance ratio to prepare amide-modified polyester. The super mol. structures were tested by DSC d. method and also the moisture absorption was measured. It was found out that the moisture absorption increased with the increase of T4T content in the modified polyester.

AB Alternating poly(ester amide)s consisting of 1,4-butylene and diol spacing entities (4NTm and 4NTm,p) were studied using solid-state NMR techniques. The direct monitoring of the NMR relaxation behavior of different ester and amide moieties suggested a significant impact of spacer length on the mol. dynamics. Crystallization domains of the diol spacers of annealed

4NTm as well as 4NTm,p poly(ester amide)s were identified by solid-state CP-MAS 13C T1ρ relaxation measurements. From solid-state 1H T1ρ relaxation measurements, the thickness of the lamellae could be estimated including the domain sizes. Quant. anal. of 13C CP-MAS buildup curves yielded information on the crystallinity of the spacer groups. The macroscopic parameter Tm correlates on a mol. level with (macro)mol. dynamics, thickness of the lamellae, and crystallinity of diol spacers.

AB Poly(ethylene terephthalate) (PET) and poly(butylene terephthalate) were modified by diamide units (0.1-1 mol%) in an extrusion process and the crystallization behavior studied. The diamides used were: for PET, T2T-di-Me (N,N'-bis(p-carbomethoxybenzoyl)ethanediamine) and for PBT, T4T-di-Me (N,N'-bis(p-carbomethoxybenzoyl)butanediamine). The above materials were compared to talc (0.5%), this being a standard heterogeneous nucleator, and to diamide modified copolymers obtained by a reactor process. Two PET materials were used: a slowly crystallizing recycled grade obtained from soft drink bottles and a rapidly crystallizing injection molding grade. The crystallization was studied by differential scanning calorimetry (DSC) and under injection molding conditions using wedge shaped specimens; the thermal properties were studied by dynamic mech. anal. T2T-di-Me is effective in increasing the crystallization of PET in both of the extrusion compds. as well as in the reactor materials. It was also found that the crystallization temperature of poly(butylene terephthalate) could be slightly increased by the addition of nucleators.

AB An alkyl aryl terephthalate ester is formed from a dialkyl terephthalate by transesterification and then reacted with an alkyl diamine to form a bis-ester amide wherein the reaction product containing the bis-ester amide

can be directly contacted with an alkyldiamine to form a polyester-polyamide having high amide functionality without the need for purification steps. Thus, di-Me terephthalate 740, di-Ph carbonate 102,

and [BuO]4Ti 4.70 g were heated to 200° under N with distillation of di-Me carbonate, cooled to 145° after 1.5 h, amidated with 39 g 1,4-butanediol, polycondensed, giving a polymer having perchloric acid titratable 35 µeq/g, m.p. 230°, crystallization temperature 201°, amide content 11.6%, and uniformity of diamide segments with sequence length 1 92.5%, compared with 3, 221, 195, 5.0, and 92.4, resp., using a purified ester amide.

 AB Segmented polyesteramides are synthesized from N,N'-bis(p-carbomethoxybenzoyl) diamine as crystalline segments and poly(tetramethylene oxide) as soft segments. As diamine is mainly taken tetramethylene diamine, but also studied are C6 - C12 diamines. The crystalline segments are uniform in length. The poly tetramethylene oxide segments ranged in mol. weight from 250 - 2900. Also used are tetramethylene oxides with amine endgroups. As extender is sometimes used pentanediol. The polymerization is carried out in the melt at 250° for 1 h while vacuum is applied. The melting behavior of the copolymers is studied by differential scanning calorimetry. The mech. properties are investigated on injection molded bars using dynamic mech. anal. The melting temps. decrease with PTMO length and the length of the diamine. The glass transition temps. were, for the polytetramethylene oxides of mol. weight of 650 and higher, affected by the composition. The modulus decreased with PTMO length and the segmented copolymers have very high elongation's at break.

 AB Studied are the synthesis and thermal degradation of poly(butylene terephthalate) (PBT) and PBT modified with diamide segments based on di-Me 4,4'-[tetramethylenebis(iminocarbonyl)]benzoate. The diamide is synthesized from 1,4-butanediylamine and di-Me terephthalate in a PhMe/MeOH solution with LiOMe as catalyst at 60-90°C, for 7.5-40 h. The polycondensation of PBT and PBT with 20 mol% of diamide units is carried out in the melt at 255°C under a high vacuum with (iso-PrO)4Ti catalyst. The influence of the catalyst concentration (0.02-0.28 mol%) and the diamide purity is studied. The concentration of catalyst has little effect. The presence of Li was found to increase the polymerization rate. Lithium thus seems to be an interesting cocatalyst. A decreasing purity of the diamide has a lowering effect on the inherent viscosity (η_{inh}) and the T_m. A very effective way to obtain a high mol. weight polymer is the use of a short melt polymerization time followed with a solid state post-condensation at 220°-230°C. The thermal stability is studied at 255°-270°C, under nitrogen and high vacuum with a stirred melt. The degradation is followed by the change in η_{inh}, carboxylic acid end-group concentration, and amount of ester-amide interchange. The degradation consts. for PBT are comparable to the literature values. The degradation consts. for the PBT with diamide segments as measured by viscometry are the same as PBT but if calculated from the acid end-group concns. slightly higher. With increasing degradation time the uniformity of the diamide by ester-amide interchange is lost.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB Blends of amide-modified poly(butylene terephthalate) (PBTA) with polycarbonate (PC) were investigated. The focus of the study was to determine differences between blends produced from PBTA's comprised of hexanediamide units (PBTA-6) vs. butanediamide units (PBTA-4). The thermal properties of neat PBTA-4 and neat PBTA-6 were found to be vastly different. For PBTA-4, observed melting temperature increased with increasing diamide content, while PBTA-6 showed a decrease in observed m.p. with increasing diamide content. In addition, at a diamide content of 5.0 mol percent, the crystallization rate of PBTA-4 was found to be higher than that of unmodified polybutylene terephthalate (PBT); while PBTA-6 crystallized slower than PBT. With regard to blends with PC, both PBTA-4 and PBTA-6 showed less partial miscibility with PC than PBT with PC. The impact and mech. properties of the PC/PBTA blends were similar to PC/PBT blends. At low undercoolings, the inherently higher nucleation d. of the PBTA's was found to result in more complete crystallization of blends possessing a PC continuous phase.

 AB The bisesterdiamide T4T di-Me (1.5 repeat units of 1,4-butylene terephthalamide, nylon-4T, di-Me 4,4'-[1,4-butanediylbis(iminocarbonyl)]bis(benzoate) was synthesized from an excess of di-Me terephthalate and 1,4-butanediamine. Lithium methanolate was used as a catalyst. Different solvents were used to optimize the yield and purity. A pure product could be obtained by recrystn. from hot NMP. DSC and NMR analyses were used to determine the purity of the product. The melting temperature of the T4T di-Me (Tm = 265°) decreased with increasing loss of uniformity. T4T di-Me showed a transition in the crystalline structure upon heating at 160-175°

 AB Polyether-polyester-polyamides were prepared in the melt from di-Me N,N'-(1,4-butylene)bis(terephthalamate) (4NT) and ethylene or propylene glycols. The melting temps. of the polymers decreased with increasing chain length of the glycols. The undercooling for these polymers, determined at 20°/min, was low (20-35°), suggesting a very high rate of crystallization. Injection molded samples were analyzed with dynamic mech. thermal anal. The Tg decreased with increasing glycol length to 42° for tetraethylene glycol. The Tg/Tm ratio was high (0.69-0.70). The dimensional stability of the polymers above the Tg was high.

 AB Alternating copolyesteramides were prepared by polymerizing mixts. of di-Me

N,N'-tetramethyleneterephthalamide and di-Me N,N'-tetramethyleneterephthalamide in ethylene glycol. The polymers were characterized using ¹H-NMR, DSC and HPLC. The mech. properties were investigated on injection molded bars using dynamic mech. thermal anal. The melting temperature decreased with increasing isophthalamate content.

The crystallization rate, modulus above T_g and T_g were nearly constant. The high crystallization rate and the high phys. crosslink d. of the copolymers must be ascribed to

the presence of terephthalamate units which are able to crystallize fast and to form strong crystallites.

 DOCUMENT TYPE: Elsevier Science Ltd.
 LANGUAGE: Journal
 AB Strictly alternating polyesteramides were prepared by melt polymerizing di-Me N,N'-tetramethyleneterephthalamate with mixts. of aliphatic diols. in the presence of a titanium catalyst. To increase the mol. weight a solid state post condensation was applied. The composition was determined using 1H-NMR. The thermal and mech. properties were determined using DSC and dynamic mech. thermal anal. Using a mixture of diols, the structural regularity of the diester was disturbed. This disturbance caused the polymers to be fast crystallizing and highly crystalline. The melting temperature decreased linearly with increasing length of the diols and the melting temps. were lower with mixed diols than with a single diol. The polymers have high Tg and high modulus above the Tg. Disturbing the alternating structure of the polyesteramide by esteramide interchange reactions resulted in loss of thermal and mech. properties.

AB The title polymers have repeating unit of essentially -COR1CONHR2NHCOR1CO2R3O- with three diad sequences -O2CR1CONH- (X), -NHCOR1CONH- (Y), and -O2CR1CO2- (Z) (X + Y + Z = 100 mol%) with X content 70-100 mol% [R1-3 = (un)substituted aliphatic, alicyclic, aromatic group].
 Di-Me terephthalate and hexamethylenediamine were reacted in 1:0.1 molar ratio in toluene in the presence of Ti(OBu)4 under reflux for 6 h to obtain p-MeO2CC6H4CONH(CH2)6NHCOC6H4CO2Me-p which was then stirred with hexamethylene glycol in the presence of Ti(OBu)4 at 260° for 30 min under N, evacuated to 0.3 mmHg over 1 h, heated to 280° over 1 h, then further polymerized for 3 h to obtain a polymer with Mn 15,000.

AB Segmented polyesteramides have been synthesized from N,N'-bis(p-carbomethoxybenzoyl)butanediamine as crystalline segments and mixts. of poly(tetramethylene oxide) (mol. weight 1000) and 1,5-pentanediol as soft segments. The polymerization was carried out in the melt at 250°C for 1 h

while vacuum was applied. The melting behavior of the copolymers was studied by differential scanning calorimetry. The mech. properties were investigated on injection molded bars, using dynamic mech. anal. The copolymers with more than 50% molar ratio pentanediol showed two glass transition temps. and two melting temps. The glass transition temps.

were not affected by the composition. The melting temps. increased with pentanediol content. The undercooling for these copolymers was very small, which means that these segmented copolymers crystallize very fast.

AB Polybutylene terephthalate (PBT) and polyethylene terephthalate (PET) chains were modified with a diamide, N,N'-bis(p-carbomethoxybenzoyl)-1,4-butanediamine (I). In these polyestaramides the amide segments are of uniform length. The diamide unit and the PBT have a high structural similarity and a synergism can be expected. The melting temps. of the diamide modified PBT (PBTA) increase steadily with amide content. The glass transition temperature increases linearly with amide content. The shear modulus at 150°C is for the PBTA copolymers appreciable higher than for the PBT. These higher moduli above the Tg suggest a higher crystallinity of the copolymers. Although the structural similarity of the diamide and PBT the structures were not isomorphous. A small amount of diamide I in PBT and in PET increased the crystallization rate. We expect that the uniform diamide units order first in very thin lamella and these lamella are the nucleation sites for the polyesters. These amide modified polyesters have interesting engineering plastics properties.

AB Polyester/polyesteramide blends comprise (A) about 95-99.99 weight% of a polyester which comprises a dicarboxylic acid component comprising repeating units from at least 85 mol% terephthalic acid, naphthalene-2,6-dicarboxylic acid or mixts. of terephthalic acid and naphthalene-2,6-dicarboxylic acid and a diol component comprising repeating units from at least 85 mol% ethylene glycol, said mole percents being based on 100 mol% dicarboxylic acid and at least 100 mol% diol and (B) about 5-0.01 weight% of a polyesteramide of the formula: A(N)x(D)y where

A is a dicarboxylic acid selected from aromatic or cycloaliph. dicarboxylic acids having 8 to 14 carbon atoms or aliphatic dicarboxylic acids having 3 to 24 carbon atoms, N is a diamine having 2 to 24 carbon atoms, D is a diol having 2 to 14 carbon atoms, x is an integer from 0.01 to 0.99, and y is an integer from 0.99 to 0.01. The blends are useful for a variety of molded articles including containers, films and sheets, which display good barrier properties and low color and acetaldehyde concentration. A light yellow semicryst. polyesteramide having Mn 11,060, Mw 44,040, and MWD 3.98, was

 AB Copolyamides based on poly(m-phenylene isophthalamide) and poly(p-phenylene terephthalamide), to which 1,6-diaminohexane units were regularly inserted every 3 or 5 phenylene monomer units, were synthesized. The copolymers were obtained by condensation of individually prepared diamino- and dicarboxylic-building blocks via the Yamazaki-Higashi reaction. Solubility of the copolyamides are discussed in relation with the structure.

 AB Poly(ester amide) copolymers (PBTA) based on poly(butylene terephthalate) (PBT) and the diamide of butanediamine and di-Me terephthalate (N,N'-bis(p-carbo-methoxybenzoyl)butanediamine) were studied. The amide content in PBTA was varied from 0-50 mol%. The melting and crystallization behavior was analyzed with differential scanning calorimetry. The degree of undercooling is taken as a measure for the rate of crystallization. The torsion modulus as a function of temperature and the position of the glass transition temperature (T_g) were studied with dynamic mech. anal. On injection molded samples the tensile properties at RT were determined. The crystalline spacings were studied with wide angle x-ray diffraction. In the PBTA only one T_g could be observed which means that the amorphous phase was homogeneous. The crystalline spacings of PBT and Nylon 4,T were not the same and the PBTA has something of both, which means that the ester and amide repeat units are not isomorphous. Despite the absence of isomorphous crystallization the melting temperature increased nearly linearly with the amide content, the crystallinity remained high, and very surprisingly the rate of crystallization even increased. Also in polyethylene terephthalate these diamide segments increased the rate of crystallization. A model is proposed with the diamides as homogeneous nucleation sites (adjacent crystallization) to explain the fast crystallization behavior of these copolymers.

 AB The thermal stability of a poly(ester amide) (PBTA) based on 1,4-butanediol, di-Me terephthalate, and N,N'-bis(p-carbomethoxybenzoyl)-1,4-butanediamine was studied. The development of inherent viscosity and end group concentration was determined during prolonged condensation reactions at 255-275°. Anal. of the kinetics lead to degradation rate consts. for poly(butylene terephthalate) (PBT) and PBTA with 20 mol% amide. The degradation rate of this PBTA was comparable to that of PBT, so β-elimination of the ester groups is the main degradation mechanism in PBTA. At high temps. ester-amide interchange reactions also take place in PBTA. A change in the melting temperature of PBTA has been related to the decreasing uniformity of the amide segment length. The decomposition was further studied by thermogravimetry and mass spectrometry.

AB The synthesis of poly(ester amide) copolymers (PBTA) based on poly(butylene terephthalate) and nylon 4T by polycondensing 1,4-butanediol, di-Me terephthalate, and N,N'-bis(p-carbomethoxybenzoyl)-1,4-butanediamine has been carried out. Different melt and solid state condensation reactors were used. Polycondensation to give PBTA with

melt of amide units was carried out in the melt at 255-265° under high vacuum. The inherent viscosity η_{inh} , the amino and carboxylic acid end-group concns., and the melting temperature (T_m) were determined

The influence of diamide purity and concentration of Ti catalyst (0.02-0.28 mol%) was studied. The concentration of Ti catalyst had little effect. The purity of the

diamide had an effect on η_{inh} and T_m . Postcondensation in the solid phase, 20°-30° below T_m , was most effective after short melt polymerization times.

AB The catalysts for the ester interchange reaction and the polycondensation of N,N'-bis(p-carbomethoxybenzoyl) hexamethylenediamine with 1,6-hexanediol were developed, and the ester interchange rate and the kinetics of the melt condensation polymerization were studied. The synthesized polymer was characterized by IR, NMR, and was identified as poly(esteramide).

polyesteramide with an alternating microstructure. The properties of the polymer were studied by DTA, viscosimeter, and TGA. The synthesized alternating polyesteramide showed higher viscosity, higher m.p., and similar resistance to thermal oxidation as compared with poly(ethylene terephthalate).

AB Substantially aliphatic polyester-polyamides (PEA) have amide/ester ratio 1:21, and more preferably where 280% of the amide units are separated by ≥ 1 of the ester units. The Vicat softening point of the title blend is improved over the corresponding polycarbonate/polyester blend. Thus, di-Me terephthalate and 1,4-diaminobutane were stirred heated at 140° in the presence of LiOMe to give a bisesterdiamide, which was polymerized with di-Me terephthalate and 1,4-butanediol to give a

PEA. A similar PEA having 5 mol% 1,4-diaminobutane (PEA melt temperature 226°; crystallization temperature 190°; mol. weight 93,000) was blended with

polycarbonate, impact modifier, stabilizer, and TiO₂ at 265° and molded to give test pieces having Vicat softening point 137°, Izod impact strength (23°) 52, modulus 2175, and elongation 121%, vs. 128, 55, 2200, and 135, resp., for polybutylene terephthalate/polycarbonate blends.

AB Disclosed are polyesteramide resin compns. wherein the polyesteramide is substantially devoid of units derived from butanediol. The ratio of amide

to ester units in the polyesteramide is preferably <1:3. Preferred polyesteramides have ≥80% of the amide units separated by ≥1 of the ester units. The polyesteramides have a narrower range between the crystallization and melting temps. (undercooling) than the corresponding polyester and crystallize faster. In an example, a 1:2 condensate of ethylenediamine and di-Me terephthalate (I) was prepared and incorporated (10%) into a polyester prepared from I and ethylene glycol. This polyesteramide had an undercooling range of of 43° compared to 69° for poly(ethylene terephthalate).

 AB N,N'-bis(p-carbomethoxybenzoyl)hexamethylenediamine (I) was from di-Me terephthalate with 1,6-hexanediamine and characterized by IR, NMR, DSC, and elemental anal. The reaction rate followed first order kinetics with respect to concentration of 1,6-hexanediamine. Polymerization of I with 1,6-hexanediol gave polyamide-polyesters having intrinsic viscosity .apprx.1.0.

 AB Segmented copolymers were synthesized from polytetramethylene glycol or aliphatic diols and N,N'-bis(p-carbomethoxybenzoyl)butanediamine. The polymers are prepared in the melt with Ti(OPr-iso)4 as catalyst, for 30 min at 160-170° under atmospheric pressure and 60 min at 250-260° under a high vacuum. The polymers were studied by solution viscometry, differential scanning calorimetry and dynamic mech. thermal anal. The melting and glass transition temps. decreased with increasing soft block length. The crystalline order of the uniform unit is high and not very dependent on the soft block length. The rate of crystallization is very fast. The moduli of these polymers are hardly dependent on temperature in the region between T_g and m.p..

 AB Segmented poly(ether ester amide) copolymers with short (M = 382) partially aromatic ester amide units of uniform length and segments of poly(tetramethylene oxide) (I) are synthesized in the melt. The polymers show phase separation into two or three phases. The influence of the I segment length on the following properties was studied: the glass temperature of the amorphous phase, the melting temperature of the crystalline I and the melting and crystallization behavior of the uniform polyesteramide units. Volume fraction and d. of each phase were determined. The poly(ester amide) units crystallize in lamellar structures; their sizes were studied using wide- and small-angle x-ray scattering. The polymers were melt processed and their mech. properties were investigated using dynamic mech. thermal anal. and tensile tests. Poly(ester amide) crystallinity, crystalline structure and crystallite size were found to be almost independent of I segment length. The decrease in hard-segment melting temperature with increasing I segment length is explained as being due to a solvent effect of the soft phase. The copolymers crystallize very fast, and the modulus in the rubber region is essentially independent of temperature. The copolymers with long I segments (M = 2000 and 2900) have a low glass transition temperature (-65°); the materials are very soft and have an elongation at break of over 1000%. The copolymer with the shortest I segments (M = 250) has a glass transition temperature of 43° and the material is hard at room temperature.

AB Poly(butylene terephthalate) (I)-nylon 4T (II) copolymers are synthesized from the diamide of diaminobutane and di-Me terephthalate (II) with butane

 diol and more II in a concentration range $\leq 50\%$ II. The polymerization conditions were similar to those for I: first, a melt polymerization, followed by solid-state post-condensation. The materials were studied by DSC (melting and crystallization behavior) and dynamic mech. thermal anal. (glass transitions and torsion moduli). The water absorptions were determined at 100% relative humidity. By increasing II content in the copolymers, melting temps. were

increased strongly, heats of fusion were decreased slightly, and glass transition temps. were increased linearly. The torsion moduli above the glass transition temperature were higher.

AB Segmented and random polyester-polyamides with hexamethylene bis(terephthalamate) (A) units differed markedly in texture and properties from those with trimethylhexamethylene bis(terephthalamate) (B) units.

In segmented polymers with A units, the polyester component did not crystallize spontaneously from the melt but formed a distinct phase of low glass temperature and some degree of subcryst. order which crystallizes under stress; those with B units possessed a mixed phase structure coexisting with aliphatic polyester crystallinity and are of higher modulus than those with A. The differences, which also occur in the amide group IR frequencies, were correlated with the solubility parameters of the sub-species.

AB Polymers with good mech. properties and resistance to heat, solvents and fire contain the units -Ar1(R1)aCON(R5)R7N(R6)COAr2(R2)bS- and/or I (Ar1-4 = arylene; R1-6 = alkyl, cycloalkyl, aryl, alkoxy, acyl, arylakyl, and optionally R5-6 = H; R7-9 = alkylene; a-d = 0-4). Heating 0.04 mol Na2S.2.7H2O in 150 mL methylpyrrolidone (II) at 200° with distillation of H2O, cooling, adding 0.04 mol N,N'-hexamethylenebis(4-chlorobenzamide)

and 50 mL II, and heating at 250° for 6 h gave a crystalline polymer with decomposition temperature 425°

 AB Three model compds. of poly(tetramethyleneterephthalamide) were synthesized and characterized using single crystal x-ray diffractometry, IR spectroscopy, and 13C CP/MAS NMR spectroscopy. The model compds. are p-substituted N,N'-tetramethylene dibenzamides, where the substituents are OMe, tert-Bu, CN, and CH3 groups crystal structure detns. revealed 3 distinct conformations for the CONH (CH2)4 NHCO sequence of atoms. The conformation was all trans for OMe, tgcttg-t for the tert-Bu substituent, and tcttg-t for the CN substituent (t = trans, simeq. 180°, gt = gauche, simeq. ± 60°, and st = skew, simeq. ± 120°). In all three derivs., the dihedral angle between the aromatic ring and the amide plane was .apprx.30°. On the basis of its IR and solid state NMR spectra, it was proposed that N,N'-tetramethylene di-p-Me benzamide has a crystal structure comparable to that of its unsubstituted analog. The methylenic sequence of the parent polyamide had the tgcttg-t conformation. Furthermore, the polyamide chains formed sheets within which the chains, parallel to one another, were connected through H bonds.

 AB In order to establish the conformation of poly(trimethyleneterephthalamide) or 3T nylon and of the parent pentamethylene (5T nylon) and heptamethylene (7T nylon) polyamides, three model compds., p-RC6H4CONH(CH2)nNHCOC6H4R-p (R = methoxy, n = 3; R = Me, n = 5,7), were synthesized and characterized by X-ray diffraction, IR spectroscopy, and solid-state CP/MAS 13C NMR. All three compds. showed comparable conformations for the CONH(CH2)nNHC sequence of atoms. They were rggt, rggttt, and rggttttt for n = 3, 5, and 7, resp. (g = gauche, simeq. 60°, t = trans = 180°; s = 80-90°). Although chemical syn., the extreme torsion angles of the mols. differed by simeq. 90°. The pentamethylene- and heptamethylene bis(p-methylbenzamide) mols. were held through 4 H bonds to 2 other distinct mols., thus forming ribbons extending parallel to a unit-cell edge. On the other hand, trimethylene bis(p-methoxybenzamide) formed H bonds with 4 other mols. All these H bonds were almost linear.

AB The morphol. of poly(ether ester amides) [66094-41-5] (PEEA) was investigated by wide- and small-angle x-ray scattering and electron microscopy techniques. The copolymers are based on poly(ester amide) (6NT6) hard segments (containing an average number k of 6NT6 consecutive units)

alternating with poly(tetramethylene oxide) (PTMO) soft segments of constant length (mol. weight .apprx.900). The fraction of crystallized 6NT6 increases by increasing the PTMO content (i.e., by lowering k), approaching unity for k

→ 1. The morphol. is of the lamellar type, with both thickness and width of the crystalline domains (6NT6) decreasing with the increase of PTMO

content; in the interlamellar amorphous regions both soft and hard segments tend to segregate in sep. domains. For k .simeq. 1, crystalline domains, formed essentially by isolated 6NT6 units, alternate with amorphous PTMO interlayers. The mechanism of evolution of the morphol. structure as a function of the copolymer composition is discussed.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB The structure and mech. properties of elastoplastic copolymer materials, prepared from diesterdiamide [p-MeO₂CC₆H₄CONH(CH₂)₃]₂, 1,6-hexanediol, and polytetramethylene glycol or polyethylene glycol via catalyzed transesterification and melt polycondensation (Ital. Patent Appln. 255486A/76), were studied by transmission electron microscopy and small-angle x-ray diffraction. Both poly(ester-amide) (I)-poly(tetramethylene oxide) (II) and I-poly(ethylene oxide) (III), i.e., copolymers based on esteramide hard segments and polyether (II or III) soft segments, possess a lamellar morphol. As the fraction of crystallized hard segment increases with increasing soft segment content, the crystallization level remains relatively high over the entire composition range, which accounts for good mech. properties of both series of copolymers. II and I form sep. domains in the amorphous interlamellar regions of I-II (semicompatible system), whereas amorphous I and III mix in I-III (compatible system). The different behavior is attributed to different solubility parameters of the components.

 AB The morphol. and thermodyn. properties were studied of copolyester-amides [66094-41-5] containing random sequences of -COC₆H₄CONH(CH₂)₆NHCOC₆H₄CO₂(CH₂)₆O- hard segments and -COC₆H₄CONH(CH₂)₆NHCOC₆H₄CO₂[(CH₂)₄O]_n- soft segments. The samples were crystallized from DMSO at 30°. The trend in long spacing of the lamellas, determined by small-angle x-ray scattering measurements, is constant up to a soft phase content of 40%, due to hard phase single crystals, but increases for samples containing ≥50% soft phase. The degree of crystallinity was reduced with increasing soft phase content. The differential scanning calorimetry thermograms, m.p., and apparent enthalpy of fusion were also affected by the molar ratio of the segments, but the variation was not linearly dependent on the amount of soft phase.

AB The title elastoplastic copolymers were prepared by transesterification at 240° of a diester with preformed amide linkages, 1,6-hexanediol, and poly(tetramethylene glycol ether), followed by random polycondensation at 270° of the diglycol compds. produced to give an A-B block copolymer (66094-41-5). The d., m.p., crystallinity, and enthalpy of fusion were determined for polymers with different A:B ratios. The influence of structure on the properties of the polymers is discussed in relation to the sequence distribution statistics for finite chain length, and the role of mol. weight is specified.

AB Rubber [66094-41-5] prepared from MeOCO-p-C₆H₄CONH(CH₂)₆NHCO-p-C₆H₄COOMe (I), HO(CH₂)₆OH, and H[O(CH₂)₄]NOH consisted of alternating I hard segments and polyether soft segments and had a morphol. consisting of continuous interpenetrating crystalline and amorphous regions. I segments crystallized as lamellar domains 2.5-5 nm thick with 30-300 nm lateral extension, depending on I content. The fraction of crystallized I increased with increasing polyether content, approaching 1 for compns. close to alternating I-polyether. When crystallization of I was partial, the uncrystd. I and polyether segments tended to form sep. domains, limited in size, in the amorphous region. When the polymer composition approached that of I homopolymer, the amorphous phase became more compatible.

AB Seven epoxy resin hardeners (I; R = Me or Et; R1 = H or Me; n = 1-3; Z = Ph, (CH₂)₆, methylenedi-p-phenylene, 4-methyl-1,3-phenylene, etc.) are manufactured by reacting dialkylaminoalkyl trimellitates (II; R = Me or Et; R1 = H or Me) with (poly)isocyanates. Unlike II, I are not deliquescent or adhesive. Thus, 0.2 mol trimellitic anhydride [552-30-7] in DMF was heated with 0.2 mol Me₂NCH₂CH₂OH [108-01-0] at 120° for 2 h, and then heated 4 h with 0.1 mol methylenedi-p-phenylene diisocyanate [101-68-8] to give 9% I (R = Me, R1 = H, n = 2, Z = methylenedi-p-phenylene) [67822-87-0].

AB The geometry of the polycondensation reactor and polycondensation temperature strongly influenced the preparation and degradation kinetics of 1,6-hexanediol-N,N'-bis(p-carbomethoxybenzoyl)hexamethylenediamine copolymer [51253-53-3]. ¹³C and ¹H spectra of samples heated above the m.p. showed that extensive mol. rearrangement occurred by ester-amide interchange with almost random distribution of ester and amide links. On heavy thermal treatment moderate enrichment of the amide group fraction occurred and there was a tendency towards formation of polyamide blocks.

 AB The changes in enthalpy, entropy, and volume of 4 polyester-amides, [COC6H4CONH(CH2)nNHCOC6H4CO2(CH2)mO]x (C6H4 para disubstituted; n = 6, m = 6; n = 12, m = 2, 6, 12), upon melting were shown by dilatometric and differential scanning calorimetry to vary regularly with the number of CH2 groups/repeating unit. Entropy of fusion exptl. results were compared with theor. predictions. The rigidity of the -p-O2CC6H4CONH- residues and the persistence of interchain H bonds into the molten state influenced melting thermodyn.

AB Low-mol. weight poly(ethylene benzenedicarboxylate) and N,N'-bis(4-hydroxycarboalkoxybenzoyl)alkylenediamine reacted in melt to give the title product, useful for preparing fibers. Thus, 0.9 mole poly(ethylene terephthalate) (25038-59-9) and 0.1 mole N,N'-bis(p-m-hydroxyhexyloxycarbonylbenzoyl)hexamethylenediamine (I) [37571-47-4] reacted in the presence of (BuO)4Ti at 260.deg. and in vacuo to give a polyester amide, m. 215.deg.. The polyester amide was spun at 255.deg. and drawn at 70.deg. to give fibers having 1.96 denier, 20.4% elongation, and 65 g/denier modulus. N,N'-bis(p-m-hydroxybutoxycarbonylbenzoyl)hexamethylenediamine [37571-48-5] was used instead of I.

AB 1,4-Bis[β-(p-methoxycarbonylphenoxy)ethoxy]benzene-ethylene glycol copolymer (I) [34873-41-1], 1,4-bis[β-(p-methoxycarbonylphenoxy)ethoxy]benzene-1,4-cyclohexanedimethanol copolymer [34873-42-2], 1,4-bis[β-(p-methoxycarbonylphenoxy)ethoxy]benzene-trans-1,4-cyclohexanedimethanol copolymer [34871-73-3], 1,5-bis[β-(p-methoxycarbonylphenoxy)ethoxy]naphthalene-ethylene glycol copolymer [34873-43-3], and 2,6-bis[β-(p-methoxycarbonylphenoxy)ethoxy]naphthalene-ethylene glycol copolymer [34873-44-4] were prepared and melt-spun into fibers. For example, hydroquinone, ethylene chlorohydrin, KOH, and water were heated to give 1,4-bis[β-(p-toluenesulfonyloxy)ethoxy]benzene, which was treated with p-toluenesulfonyl chloride in pyridine to give 1,4-bis[β-(p-toluenesulfonyloxy)ethoxy]benzene (II). Me p-hydroxybenzoate in II, acetone, and water was refluxed to give 1,4-bis[β-(p-methoxycarbonylphenoxy)ethoxy]benzene, which was treated with ethylene glycol, titanium tert-butoxide, and antioxidant to give I. This polymer was melt-spun on a microd spinner and drawn to 5 times its original length over a heated pin to give a fiber with initial modulus 186 g/denier, breaking tenacity 6.36 g/denier, and breaking elongation 5.1%. Addnl. polymers (22) were prepared, although not incorporated into fibers.

 AB The title compds. having antifertility activity and hypocholesteremic activity in rats were prepared. Thus, 4-methoxybenzoyl chloride was added to 1,5-pentanediamine in ethylene dichloride containing 10% aqueous NaOH to give N,N'-pentamethylenebis(4-methoxybenzamide) (I). Similarly prepared were approx. 100 analogs of I.

 AB The title compds. (I) were prepared by the treatment of benzoylhalides with alkylenediamines. Thus, 18.8 g p-MeOC6H4COC1 in 100 ml ClCH2CH2Cl was added within 15 min to a cooled mixture of 5.1 g NH2(CH2)5NH2, 200 ml 10% NaOH, and 500 ml ClCH2CH2Cl and stirred 30 min to give 14.4 g I [R = R2 = R3 = H, R1 = Me, X = (CH2)5], m. 160-1°. Similarly prepared were the following I [X = (CH2)n] (R, R1, R2, R3, n, and m.p. given): H, Me, H,

6, 177-8°; H, Me, H, H, 7, 157-9°; H, Me, H, H, 8, 175-6°; H, Me, H, H, 9, 156-7°; H, Et, H, H, 7, 156-7°; H, iso-Pr, H, H, 7, 135-6°; H, Bu, H, H, 7, 151-2°; H, C5H11, H, H, 7, 155-6°; H, Me, MeO, H, 7, 160-1°; H, Me, Cl, H, 7, 132-3°; H, CF3, H, H, 6, 179-80°; H, CF3, H, H, 150-1°; H, CF3, H, H, 8, 164-5°; H, CCl3, H, H, 7, 152-3° (decomposition); H, ClFCHCF2, H, H, 7, 153-4°; H, cyclohexyl, H, H, 7, 144-5°; H, CD3, H, H, 7, 156-9°; H, CF3CH2, H, H, 7, 167-8°; H, Cl2C:CH, H, H, 7, 144-5°; H, allyl, H, H, 7, 152-3°; H, Me, PhCH2O, PhCH2O, 7 (Ia), 206-9°; H, CD25, H, H, 7, 151-2°; Me, CF3, H, H, 7, 160-4°; H, CF3, H, H, 9, 144-5°; H, CF3, H, H, 5, 154-5°; H, CF3, H, H, 10, 154-5°; H, Me, H, H, 10, 160-70°; Et, Me, H, H, 7, 160-03°; 240-50°; H, Me, H, H, 11, 150-1°; H, CF3, H, H, 12, 158-9°; H, Me, H, H, 12, 169-70°; H, CF3, H, H, 11, 141.5-2.5°; H, (R1R2 =) CH2O, H, 6, 183-5°; H, (R1R2 =) CH2O, H, 7, 151-2°; H, (R1R2 =) CH2O,

L7 ANSWER 75 OF 83 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)
 H, 8, 179-80°; H, (R1R2 =) CH2O, H, 5, 158-60°; and I [R = R2 = R3 = H] (R1, X, and m.p. given): Me, cis-1,4-cyclohexylenedimethylene, 224-6°; Me, trans-1,4-cyclohexylenedimethylene, 258-60°; Me, p-CH2C6H4CH2, 249-50°; CF3, CH2CMe2CH2-CHMeCH2CH2, 97-9°; Me, (CH2)2S2(CH2)2, 136-8° and 154-5°; CF3, (CH2)2S2(CH2)2, 150-1°; CF3, (CH2)2Se2(CH2)2, 140-2°. Treatment of 12.8 g p-CF3OC6H4COC1 in 50 ml ClCH2CH2Cl with 4.50 g H2NMeCH(CH2)5CHMeNH2 in 100 ml ClCH2CH2Cl and 8.4 2 g K2CO3 gave 11.5 g I [R = R2 = R3 = H, R1 = CF3, X = MeCH(CH2)5CHMe], m. 156-60°. Similarly prepd. were the following I [R = R2 = R3 = H] (R1, X, and m.p. given): CF3, (CH2)3NMe(CH2)3, 110-11°; CF3, (CH2)3O(CH2)3, 118.5-19.5° (cor.); CF3, (CH2)3CO(CH2)3, 151-2° (ethylene ketal m. 136.5-7.5°); CF3, trans-1,4-cyclohexylenedimethylene, 279-80°; Ph, (CH2)7, 164-5°; CF3, Me2C(CH2)3CHMe(CH2)2, 82-5°; Me, (CH2)2CH:CH(CH2)3, 141-3°; CF3, (CH2)2C:tpibond.C(CH2)3 (Ib), 153-4°. 1,4,7-Tris(p-trifluoromethoxybenzamido)heptane, m. 234-5°, and N,N-bis[3-(p-methoxybenzamido)propyl]-p-methoxybenzamide, m. 117-18°, were obtained similarly. 1,1'-Carbonyldiimidazole (16.2 g) was mixed with 19.4 g p-tert-BuC6H4CO2H in 250 ml tetrahydrofuran, stirred 30 min at room temp. and treated with 6.5 g NH2(CH2)7NH2 to give I [R = R2 = R3 = H, R1 =

tert-Bu, X = (CH2)7], m. 135-6°. Similarly prepd. were the following I [R = R2 = R3 = H, X = (CH2)7] (R1 and m.p. given): HCF3, 138-9°; MeOCH2CH2, 140-1°. I [R = H, R1 = Me, R2 = R3 = OH, X = (CH2)7], m. 162-4°, and I [R = R2 = R3 = H, R1 = CF3, X = cis-(CH2)2CH:CH(CH2)3], m. 111-13°, were obtained on hydrogenation of Ia and Ib, resp. Refluxing I [R = R1 = R2 = R3 = H, X = (CH2)7] with Et2NCH2CH2Cl or cyclopentyl bromide gave I [R = R2 = R3 = H, R1 = Et2NCH2CH2, X = (CH2)7], m. 130-1°, or I [R = R2 = R3 = H, R1 = cyclopentyl, X = (CH2)7], m. 152-4°, resp. In rats 256 mg I/day reduced the serum cholesterol level by 20-5%, 5-100 mg I/day increased the wt. of the adrenal gland by 25-100%, and 5-500 mg I/kg/day had antifertility effects.

AB The title diamides are prepared by treating an alkyl aryl ester of an aromatic carboxylic acid, having carboxylic groups meta or para to each other, with primary and secondary mono- and diamines. Only the aryl group reacts with the amine and no unusable by-products are produced. Thus, a solution of 13.5 parts stearylamine in 50 ml. C6H6 was added over a 20-min. period to a refluxing solution of 14.9 parts Bu Ph terephthalate in 50 ml.

C6H6. After an addnl. hr. at 80°, the solution was cooled and the product was separated from the concentrated mother liquor to yield 80.5% N-octadecylterephthalamidic acid butyl ester, m. 89° (Bu acetate-MeOH). Other ester amides prepared include N-tetradecylisophthalamidic acid ethyl ester, m. 56.5-8.0° (MeOH), N,N'-bis(p-butoxycarbonylbenzoyl)-hexamethylenediamine, m. 191.5-2.0°, N,N'-bis(m-ethoxycarbonylbenzoyl)hexamethylenediamine, m. 137-9° (xylene), and isophthalic acid ethyl ester morpholide, b. 196-200°/1 torr. The ester amides are useful as lubricant thickening agents and as bases for polycondensation products.

 AB Fiber-forming polyamidoesters were prepared from [p-AcOC6H4]CONH(CH2)3]2 (I) and (or) [m-AcOC6H4]CONH(CH2)3]2 and (HOCH2)2 (II). Thus, 1 mole I and 2.5 moles II were first heated 5 hrs. at 200-40° in a N stream, and then heated 18 hrs. at 240°/1-2 mm. Ti(OBu)4 was found to be the most effective catalyst for the polycondensation. This polymer m. 285-95° and had sp. viscosity 1.04, as a 0.5% solution in tricresol. From the polymer melt, fibers were drawn which could be heated in air to 150° without any change of phys. and mech. properties. The temperature of rupture of the nonloaded fiber was 255°, the elasticity modulus 1370 kg./mm.2, compared with the resp. values of 226° and 2300 kg./mm.2 for poly(ethylene glycol terephthalate) and 180° and 450 kg./mm.2 for polycaprolactam. Polyamidoesters were also prepared from diamine salts of monomethyl terephthalate (III) and II or HO(CH2)6OH (IV). Polycondensates from IV melted considerably lower than those from II, but variation of n in the diamine from 6 to 10 did not result in any substantial change of the m.p. The polymers prepared by using III instead of I did not reach a sufficiently high mol. weight to form fibers.

AB Ester amides of iso- and terephthalic acids were obtained in an excellent yield and quality by treating their Me aryl esters with NH₃, primary or secondary amines in inert organic solvents. Dimethyl terephthalate (I) (750g.) was heated with 730 g. PhOH, and 37.5 g. Zn salts of preliminary-run fatty acid (as catalyst) while a N stream of 1300 cc./min. was passed through the apparatus. The escaping N was passed through a descending cooler and trap kept at -50°. The sump temperature rose constantly during ester radical interchange from 192-220° the MeOH formed distilled at head temperature 64°. After 10 hrs., the batch was distilled in vacuo to give 57% pure Me Ph terephthalate (II), b₁₁ 215-30°, m. 109-10°, acid number 0.9, saponification number 439. Unreacted I recovered and subjected to the same treatment brought the total yield of II up to 98.5%. A solution of 25.6 g. II in 100 ml. C₆H₆ was heated to boiling with 27 g. stearylamine in 100 ml. C₆H₆ during 2 hrs., the mixture heated an addnl. hr. at 80° and the C₆H₆ and PhOH distilled to give 98.6% N-octadecyl-terephthalamide acid Me ester, m. 115-16° (BuOAc), acid number = 0, saponification number 127. Similarly prepared were:

bis(p-carbomethoxybenzoyl)ethylenediamine, m. 298-300°, 90% yield; N-octadecylisophthalamide acid Me ester, m. 95-6° (MeOH), 96.2%; N-decylisophthalamide acid Me ester, m. 87° (MeOH), quant. yield; N-tetradecylisophthalamide acid Me ester, m. 89° (MeOH), 99%; ester amides of primary C₂₀-2 amines, m. 98-100.5° (MeOH), 99%; methylterephthalic acid methyl ester N-decylamide, m. 62-6° (MeOH), 92%; 2,6-naphthalenedicarboxylic acid Me ester N-decylamide, m. 126-7° (MeOH), 96%; 4,4'-diphenyldicarboxylic acid Me ester N-octadecylamide, m. 152-5° (Me iso-Bu ketone), 80%; terephthalamide acid Me ester, m. 108-10°, 90%; terephthalic acid Me ester morpholide, m. 75-5.5° (BuOAc), 93%; terephthalic acid Me ester piperidine, m. 69-70° (ligroine), 93%; N,N'-bis(p-carbomethoxybenzoyl)-hexamethylenediamine, m. 236°, 94.5%; N,N'-bis(p-carbomethoxybenzoyl)-p-xylylenediamine, m. 261-2°, 93.5%; N-decylterephthalamide acid Me ester, m. 113-14° (MeOH), quant.; N,N'-bis(carbomethoxybenzoyl)hexamethylenediamine, m. 236°, 88%; N-octadecylterephthalamide acid Me ester, m. 116-17° (BuOAc),

L7 ANSWER 78 OF 83 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)

98%; N-octadecylmethylterephthalamide acid Me ester, m. 72-4° (BuOAc), quant.; isophthalic acid Me ester morpholide, b_{0.2} 170-5°, 96%; terephthalamide acid Me ester, m. 206°, 89.5%; N-tetradecylterephthalamide acid Me ester, m. 110-11° (9:1 MeOH-BuOAc), 96%; N-hexadecylisophthalamide acid Me ester, m. 91-2° (MeOH), 80%; terephthalic acid Me ester anilide, m. 193° (xylene), 78%; 2,5-dichloroterephthalic acid Me ester N-octadecylamide, m. 99.5-100°, 75%. These compds. are useful in the prepn. of thickening agents for greases, and as base materials for the prepn. of polycondensation products.

AB Addition to Brit. 994,288 (See Belg. 634,565, CA 61, 3030c). The aryl ester of a mixed alkyl aryl phthalate ester is found to react with amines to give the phthalamate. To a solution of 14.9 parts p-BuO₂CC₆H₄CO₂Ph (I) in 50 ml. refluxing C₆H₆ is added 13.5 parts C₈H₁₇NH₂ in 50 ml. C₆H₆ over 20 min. After a further 1 hr. at 80° and cooling there is obtained 19.0 parts crude p-C₈H₁₇NHCO₂CC₆H₄CO₂Bu, m. 87°, raised on crystallization from AcO₂Bu to 89°. Similarly 13.5 parts p-EtO₂CC₆H₄CO₂Ph and 10.6 parts C₁₀H₂₁NH₂ gave approx. 100% p-C₁₀H₂₁NHCO₂CC₆H₄CO₂Et, m. 56.5-8° (MeOH). A solution of 33.4 parts H₂N(CH₂)₆NH₂ (II) in 100 vols. xylene treated over 1/2 hr. at 130° with 181 parts I in 500 vols. xylene gave 133 parts N,N'-bis(p-carbobutoxybenzoyl)hexamethylenediamine (III), m. 191.5-2°. N,N'-Bis(m-carbomethoxybenzoyl)hexamethylenediamine similarly prepared in 98.5% yield m. 137-9°. From m-EtO₂CC₆H₄CO₂Ph was similarly prepared the morpholide of ethyl isophthalate, b₁ 196-200°, and from butyl m-cresyl terephthalate and II was obtained 81% III. The products are used in thickening agents for lubricating greases and as polymer intermediates.

AB The title compds. were prepared by heating the mixed methyl aryl ester of the aromatic dicarboxylic acid with NH₃ or with a mono- or diamine in an inert liquid medium. The mixed esters were obtained by reesterification of the di-Me esters. Thus, 750 g. di-Me terephthalate (I) was heated under N with 730 g. PhOH and 37.5 g. of a fatty acid Zn salt. Within 10 hrs., the temperature slowly increased to 192-220° while MeOH distilled, then the reaction mixture was distilled in vacuo to give PhOH, 133 g. I, and 466 g. Me Ph terephthalate (II), b₁₁ 215-30°, m. 104-5°. The distillation residue (455.5 g.) containing 408 g. di-Ph terephthalate was converted in a similar manner to 525 g. II by heating with 527 g. I and 517 g. PhOH. To a solution of 25.6 g. II in 100 ml. C6H6 was added portionwise within 2 hrs. a solution of 27 g. stearylamine in 100 ml. C6H6, the solution heated 1 hr. at 80°, and PhOH and C6H6 distilled to give 42.5 g. p-MeO2CC6H4CONHC18H37, m. 113-14° (BuOAc). Similarly prepared were the MeO2CC6H4CONHR (III) (position MeO2C radical, R, % yield, and m.p. given): m, C18H37, 96.2, - (b. 95-6°); m, C10H21, 100, 87° (MeOH); m, C14H29, 99, 89° (MeOH); p, H, 90, 206°; p, (NHR=) morpholino, 93, 75-5.5° (BuOAc); p, (NHR=) piperidino, 93, 69-70° (C6H6); p, C10H21, 99, 113-14° (MeOH); m, (NHR=) morpholino, 96, (oil b. 0.2-170-5°); p, C14H29, 96, 110-11° (MeOH-BuOAc); m, C16H33, 80, 91-2° (MeOH); p, Ph, 78, 193° (xylene). The following (MeO2CC6H4CONH)2R were prepared: p, CH2, 90, 298-300° (HCONMe2); p, (CH2)3, 94.5, 236°; p, p-CH2C6H4CH2, 93.5, 261-2° (xylene). The following ring-substituted III were prepared (ring substituents, position MeO2C, R, % yield, and m.p. given): Me, p, C10H21, 92, 62-6° (MeOH); Me, p, C18H37, 99, 72-4° (BuOAc); 2,5-Cl2, p, C18H37, 75, 99.5-100° (MeOH-BuOAc). N-Decyl-2,6-naphthalenedicarboxylic acid Me ester amide, m. 126-7° (MeOH), 96% yield, and N-octadecyl-4,4'-biphenyldicarboxylic

L7 ANSWER 80 OF 83 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)
 acid Me ester amide, m. 152-5° iso-BuCOMe), 80% yield, were prepd. The compds. are useful as thickening agents for lubricating greases and for the prepn. of polycondensates.

AB Highly polymeric linear polyesters are prepared from monomeric dicarboxylic compds. containing amide linkages. Thus, a monomer was prepared by dissolving 20 parts by weight of ethylenediamine in 250 parts by volume of dry pyridine, and the solution was chilled to 0°. With stirring, 127.5 parts by weight of p-carbomethoxybenzoyl chloride was added slowly to the solution at a rate such that the temperature was maintained at 0-10°. Stirring was continued for 15 min., and the reaction mixture was then poured into ice water. The light cream-colored solid which precipitated was filtered by suction. By recrystn. from EtOH, pure white, N,N'-bis(p-carbomethoxybenzoyl)-ethylenediamine, m. 245.5-6°, was obtained in a yield of 90%. Similar monomers were prepared by using hexamethylenediamine and tetramethylenediamine. The monomers were condensed with 1 or more alkylene glycols containing 2-10 C atoms by heating the reaction mixture in the presence of an ester-interchange catalyst. The glycol diester of the dicarboxylic acid, formed in the initial stage, undergoes condensation polymerization by continued heating under reduced pressure with the evolution of glycol, until the polymer reaches a fiber-forming state. Polymeric materials thus formed have an inherent viscosity of at least 0.7 and m.ps. >200°.

 AB 4-RO2CC6H4CONH(CH2)2NHCOC6H4CO2R-4 (I) were prepared by hydrolysis of terephthalic esters to ester acids, conversion to the acid chlorides with SOCl2, and treatment with the appropriate diamine in the presence of a base. Alternative syntheses for some specific I were also discussed.
 KOH (32.6 g.) in 600 mL. H2O added to 100 g. p-C6H4(CO2R)2 (II) (R = Me) (III) in 150 mL. refluxing MeOH, the mixture diluted after 10 min. with an equal volume of H2O and acidified with HCl, and the precipitate filtered off and dried gave 61.5 g. 4-RO2CC6H4CO2H (IV) (R = Me) (V), m. 228-30° (H2O). The following IV were prepared similarly (R, m.p., and % yield given): Et (VI), 169-71° (PhMe), 74; iso-Bu (VII), 153° (PhMe), 69; Bu, 132.5-3.5° (PhMe), 66. V (28.0 g.) in 32.4 g. SOCl2 refluxed 18 h. and the mixture distilled gave 27.6 g. 4-RO2CC6H4COCl (VIII) (R = Me), b10 135-8°, m. 54-5°. Similarly were prepared the following VIII (R, b.p./mm., and m.p. given): Et (IX), 133-4°/6, 27°; iso-Bu (X), 155-7°/7, 38.5°; Bu (XI), 115-18°/0.5, 13.5° (n25D 1.5260). III (4 kg.), 14 l. iso-BuOH, and 25 mL. Ti(OBu)4, distilled while maintaining the temperature of the distilling vapors at 64-8°, after 1500 mL. distillate was collected the mantle heat increased until the temperature reached 105°, the distillation continued for 0.5 h., and the mixture cooled to 50°, gave crude II (R = iso-Bu), used directly to prepare VII. Similarly was prepared II (R = Bu). II (R = Et) was prepared by the method of Koelsch (Organic Syntheses Collective Volume III, 791(1955)). Method A. H2NCH2CH2NH2 (19 g.), 700 mL. H2O, and 700 mL. C6H6 treated dropwise with stirring with 1/2 of 144 g. XI in 150 mL. C6H6 (solution A), after 10 min. the mixture treated dropwise with 1/2 of 24 g. NaOH in 150 mL. H2O (solution B) followed by 1/2 of the remainder of solution A and then 1/2 of the remainder of solution B, the sequence continued until the addition of both solns. was completed, the precipitate filtered off, washed by slurring with 3 l. portions hot H2O, dried, and crystallized from 1800 mL.

 BuOH gave 130 g. I (n = 2, R = Bu), m. 211-12°. Method B. IX (127.5 g.) added dropwise with stirring to 34.8 g. H2N(CH2)6NH2 (XII) in 500 mL. C5H5N, the mixt. stirred 15 min., poured into an ice-H2O slurry, the ppt. filtered off, and crystd. from 4 l. EtOH gave 125 g. I (n = 6, R = Et) (XIII), m. 207-8°. The following I were prepd. by method A or B (n, R, % yield, m.p. given): 0, iso-Bu, 88.2, 180-1°; 2, Me, 69, 247-8°; 2, Et, 69, 247-9°; 2, iso-Bu (XIV), 96.5, 194-5°; 3, iso-Bu, 85.6, 176-7°; 4, Me, 75.7, 255-6°; 5, iso-Bu, 86.5, 140-1°; 6, Me (XV) 63.0, 232-3°; 6, Bu, 94, 188-9°; 6, iso-Bu (XVI), 80, 165-6°. Also prepd. were 511 N, N'-di-Me deriv. of XIV, m. 138-9°, 711 N, N'-di-Me deriv. of XVI, m. 81-2°, and 56.11 N, N'-bis(p-carbomethoxybenzoyl)piperazine, m. 130-1°. On a larger scale, treatment of 4329 g. X with 1044 g. XII by method A gave 3850 g. XVI, m. 165-6°. Mixed anhydride method. VII (22.2 g.) in 100 mL. dry CHCl3 cooled to 0°, the soln. treated with 10.1 g. Et3N followed by 10.8 g. ClCO2Et, the mixt. kept 2 h. at 0-5°, treated with 5.3 g. XII in 30 mL. dry CHCl3 (CO2 was evolved and the temp. rose to 30°), the soln. kept 18 h. at 5°, washed with H2O and dil. Na2CO3, dried, evapd., and the residue crystd. from EtOH gave 20 g. XVI, m. 165-6°. PC13 method. PC13 (3.25 mL.) added slowly to 4.3 g. XII in 20 mL. C5H5N while maintaining the temp. at 10°, stirred 0.5 h. at 20°, treated with 9.3 g. II in 25 mL. warm C5H5N, the mixt. heated 3 h. on a steam bath, the excess C5H5N removed in vacuo, and the residue stirred sequentially with H2O, dil. Na2CO3, and MeOH gave 9.4 g. XIII, m. 228-9°. Isocyanate method. OCN(CH2)6NCO (1 mol) and 2 mol V heated 60 min. at 175° in C6H4Et2 gave 65% XV. Lower yields of XV were obtained when conditions (tabulated) were varied. The above procedure gave 71% XII.

AB The title esters (p-RO2CC6H4CONH)2(CH2)n (I) are intended for subsequent condensation with glycols into polyesters. Under dry conditions, 0.3 mol H2NCH2CH2NH2 in 250 mL. pyridine is chilled to 0°, with stirring 0.6 mol p-carbomethoxybenzoyl chloride slowly added at 0-10°, after 15 min. the mix poured into ice water, the precipitate filtered off, and recrystd. from EtOH giving 90% I (R = Et, n = 2), m. 245.5-6.0°. Similarly prepared were I (R, n, yield, and m.p. given): Et, 6, 88.8%, 207-8°; Me, 6, 30%, -, iso-Bu, 2, -, 196-7°. In aqueous systems, the following procedures are given: To 1 mol H2N(CH2)4NH2.2HCl in 500 mL. H2O is added 2 mol NaOH in 300 mL. H2O, then 1 l. C6H6 and 1 mol p-MeO2CC6H4COCl (II), another mole II and 150 mL. NaOH solution is added in successive portions, stirred 1 h., poured into H2O, and the precipitate dried and recrystd. from Me2NOCH giving 75.7% I (R = Me, n = 4), m. 255-6°. Diiso-Bu terephthalate is hydrolyzed to the half-ester and recrystd. from toluene giving 69.4% p-carbisobutoxybenzoic acid, m. 152-5°, which with SOCl2 gives 90% acid chloride (III), m. 36-7°. In the presence of NaOH, 13 mol III added to 6.5 mol (H2N)2(CH2)6, keeping a slight excess of III present during the addition, the precipitate dissolved in hot iso-BuOH, precipitated, and washed in MeOH gave I (R = iso-Bu, n = 6), m. 165-6°. Cf. U.S. 2,851,443.
